Abstract

This application has been implemented using ArcGIS Workflow Manager (WFM) to establish the complete linkage from planning, acquiring a site to making it ready for service. There are more than 40 user groups with approximately more than 2000 users spread across pan India. The WFM application assists in automating tasks, tracking the status and progress of jobs from beginning to end during build and mass rollout in a very short span of time. WFM is integrated with other systems like Atoll (RF Planning Tool), Document management system and Order Manager for triggering network build process. This application helps the organization at an enterprise level to update, track and manage a dispersed workforce on the common platform in a fast, disciplined and organized manner.
